Summary

Data Analyst with hands-on experience in Excel, SQL, Python and Power BI, skilled at cleaning raw data, writing analytical queries and turning findings into clear business insights. Built interactive Power BI dashboards using DAX measures and KPI cards to track sales performance. Completed a Data Analytics internship covering data cleaning, visualisation and reporting. Comfortable presenting findings through dashboards, charts and written reports.

Experience

Data Analytics Intern – Codtech IT Solutions Pvt. Ltd. Jan 2026 – Mar 2026

- Followed an end-to-end analytics workflow: dataset collection and preprocessing, data cleaning, visualisation, dashboard creation, interpretation and reporting, ending with a project review and final submission.
- Cleaned and preprocessed CSV and Excel datasets using Python (Pandas, NumPy) and Excel.
- Using Python, Matplotlib and Excel, analysed datasets to find trends and patterns and presented them as charts.Using Power BI, created dashboards and KPIs that summarised the datasets .
- Gained hands-on experience in data cleaning, visualisation, dashboard building and reporting.

Projects

Netflix Content Analytics — Streaming / Entertainment — GitHub

- Analysed Netflix's Dataset to understand content mix, genres and revenue drivers, combining three related datasets in a MySQL database.
- Used MySQL with joins, CTEs, window functions, CASE statements and aggregate functions to join the tables and answer analytical questions.
- Cleaned the data by checking missing values, NULLs and duplicates and standardising categories, then solved business questions such as movies vs. TV shows, top countries, rating mix and director analysis.
- Extended the analysis to profitability using revenue and production-cost data, identifying the most profitable titles and the highest-contributing country; queries and output screenshots are documented on GitHub.

AI-Powered Psychologist Assistant — Healthcare / Mental-Health AI — Research Paper

- Therapists depend on manual notes and subjective judgement to track client progress , to replace this our model analyses therapy sessions to give objective emotion tracking and insights.
- Developed in Python using deep-learning techniques for emotion recognition, as one module of a larger pipeline covering transcription, emotion detection and insight generation.
- The project was developed as a working prototype and documented in a research paper covering the system architecture, methodology and a review of 26 related studies.

Stock Market Price Predictor — Finance / Time-Series

- Forecast stock closing prices from historical data using deep learning, with Google (GOOG) as the example stock and about 10 years of data from Yahoo Finance.
- Built with Python, Keras (LSTM), Pandas, NumPy, Scikit-learn, Matplotlib, yfinance and Streamlit.
- Implemented a 4-layer LSTM model by following a reference implementation : data download, scaling, 100-day windows and an 80/20 train–test split.
- Visualised predicted vs. actual closing prices alongside 50/100/200-day moving averages in a Streamlit app, and learned how LSTM time-series forecasting works and where it falls short.

Education

B.Tech in CSE, NCER 2026
XIIth – RJ Junior College, Latur 2022

Skills

Data & BI: SQL, Power BI (DAX, Power Query), Advanced Excel (Pivot Tables), KPI Reporting
Python: Pandas, NumPy, Matplotlib, Seaborn, Scikit-learn, Keras
Tools: Jupyter Notebook, Git/GitHub, Streamlit
